Edexcel and BTEC Qualifications

Edexcel and BTEC qualifications are awarded by Pearson, the UK's largest awarding body. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers. For further information visit our qualifications websites at www.edexcel.com or www.btec.co.uk. Alternatively, you can get in touch with us using the details on our contact us page at www.edexcel.com/contactus.

Pearson: helping people progress, everywhere

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

1. The total number of marks for the paper is 125.

2. The Edexcel Mathematics mark schemes use the following types of marks:

- **M** marks: Method marks are awarded for 'knowing a method and attempting to apply it', unless otherwise indicated.
- **A** marks: Accuracy marks can only be awarded if the relevant method (M) marks have been earned.
- **B** marks are unconditional accuracy marks (independent of M marks)
- Marks should not be subdivided.

3. Abbreviations

   These are some of the traditional marking abbreviations that will appear in the mark schemes..

   - bod – benefit of doubt
   - ft – follow through
   - the symbol √ will be used for correct ft
   - cao – correct answer only
   - cso - correct solution only. There must be no errors in this part of the question to obtain this mark
   - isw – ignore subsequent working
   - awrt – answers which round to
   - SC: special case
   - oe – or equivalent (and appropriate)
   - d… or dep – dependent
   - indep – independent
   - dp decimal places
   - sf significant figures
   - ∗ The answer is printed on the paper or ag- answer given
   - ⎿ or d… The second mark is dependent on gaining the first mark

4. All A marks are 'correct answer only' (cao.), unless shown, for example, as A1 ft to indicate that previous wrong working is to be followed through. After a misread however, the subsequent A marks affected are treated as A ft, but manifestly absurd answers should never be awarded A marks.

5. For misreading which does not alter the character of a question or materially simplify it, deduct two from any A or B marks gained, in that part of the question affected.

6. If a candidate makes more than one attempt at any question:
   - If all but one attempt is crossed out, mark the attempt which is NOT crossed out.
   - If either all attempts are crossed out or none are crossed out, mark all the attempts and score the highest single attempt.

7. Ignore wrong working or incorrect statements following a correct answer.

General Principles for Core Mathematics Marking

(But note that specific mark schemes may sometimes override these general principles).

Method mark for solving 3 term quadratic:

1. Factorisation

$(x^2 + bx + c) = (x + p)(x + q)$, where $|pq| = |c|$, leading to $x = \ldots$

$(ax^2 + bx + c) = (mx + p)(nx + q)$, where $|pq| = |c|$ and $|mn| = |a|$, leading to $x = \ldots$

2. Formula

Attempt to use correct formula (with values for a, b and c).

3. Completing the square

Solving $x^2 + bx + c = 0$: $(x \pm \frac{b}{2})^2 \pm q \pm c$, $q \neq 0$, leading to $x = \ldots$

Method marks for differentiation and integration:

1. Differentiation

Power of at least one term decreased by 1. ($x^n \to x^{n-1}$)

2. Integration

Power of at least one term increased by 1. ($x^n \to x^{n+1}$)

Use of a formula

Where a method involves using a formula that has been learnt, the advice given in recent examiners' reports is that the formula should be quoted first.

Normal marking procedure is as follows:

Method mark for quoting a correct formula and attempting to use it, even if there are mistakes in the substitution of values.

Where the formula is not quoted, the method mark can be gained by implication from correct working with values, but may be lost if there is any mistake in the working.

Exact answers

Examiners' reports have emphasised that where, for example, an exact answer is asked for, or working with surds is clearly required, marks will normally be lost if the candidate resorts to using rounded decimals.

Answers without working

The rubric says that these may not gain full credit. Individual mark schemes will give details of what happens in particular cases. General policy is that if it could be done "in your head", detailed working would not be required. Most candidates do show working, but there are occasional awkward cases and if the mark scheme does not cover this, please contact your team leader for advice.

1. (i)	$\left\{\int \frac{2x^2+5x+1}{x^2}\,dx = \int 2+\frac{5}{x}+\frac{1}{x^2}\,dx\right\}$		
	$= 2x + 5\ln kx - \frac{1}{x}\ \{+c\}$ Where $k \neq 0$ (k is usually 1)	At least one of either $\pm\frac{A}{x} \to \pm\alpha\ln kx$ or $\pm\frac{B}{x^2} \to \pm\beta x^{-1}$; A, B, α, β non zero.	M1
		At least 2 out of the 3 terms are correct. e.g. 2 of $2x, -\frac{1}{x}, 5\ln kx$	A1
		$2x + 5\ln kx - \frac{1}{x}$ with or without $+c$ all on one line and apply isw once seen. Do not allow $+\frac{1}{-x}$ for $-\frac{1}{x}$	A1
			[3]
	(i) Alternative by parts I:		
	$\left\{\int (2x^2+5x+1)x^{-2}\,dx = -\frac{1}{x}(2x^2+5x+1) + \int \frac{1}{x}(4x+5)\,dx\right\}$		
	$= -2x - 5 - \frac{1}{x} + 4x + 5\ln kx\ \{+c\}$	At least one of either $\pm\frac{A}{x} \to \pm\alpha\ln kx$ or $\pm\frac{B}{x^2} \to \pm\beta x^{-1}$; A, B, α, β non zero.	M1
		At least 2 out of the 3 terms are correct. At least 2 of $2x, -\frac{1}{x}, 5\ln kx$	A1
	$= 2x - 5 - \frac{1}{x} + 5\ln kx\ \{+c\}$ Where $k \neq 0$ (k is usually 1)	$2x - 5 - \frac{1}{x} + 5\ln kx$ with or without $+c$ Or $2x + 5\ln kx - \frac{1}{x}$ with or without $+c$ all on one line and apply isw once seen. Do not allow $+\frac{1}{-x}$ for $-\frac{1}{x}$	A1

	(i) Alternative by parts II:		
	$\left\{\int (2x^2+5x+1)x^{-2}\ \mathrm{d}x = x^{-2}\left(\frac{2x^3}{3}+\frac{5x^2}{2}+x\right)+\int 2x^{-3}\left(\frac{2x^3}{3}+\frac{5x^2}{2}+x\right)\mathrm{d}x\right\}$		
	$= \frac{2x}{3}+\frac{5}{2}+\frac{1}{x}+\frac{4x}{3}+5\ln kx-\frac{2}{x}\ \{+c\}$	At least one of either $\pm\frac{A}{x}\to\pm\alpha\ln kx$ or $\pm\frac{B}{x^2}\to\pm\beta x^{-1}$; A, B, α, β non zero.	M1
		At least 2 out of the 3 terms are correct. At least 2 of $2x, -\frac{1}{x}, 5\ln kx$	A1
	$= 2x+\frac{5}{2}-\frac{1}{x}+5\ln kx\ \{+c\}$ Where $k \neq 0$ (k is usually 1)	$2x+\frac{5}{2}-\frac{1}{x}+5\ln kx$ with or without $+c$ or $2x+5\ln kx-\frac{1}{x}$ with or without $+c$ all on one line and apply isw once seen. Do not allow $+\frac{1}{-x}$ for $-\frac{1}{x}$	A1

(i) Alternative:		
$\left\{\int \frac{2x^2+5x+1}{x^2}\ \mathrm{d}x = \int 2+\frac{5x+1}{x^2}\ \mathrm{d}x = \int 2+(5x+1)x^{-2}\ \mathrm{d}x\right\} = 2x-\frac{1}{x}(5x+1)+\int\frac{5}{x}\ \mathrm{d}x$		
$= 2x-5-\frac{1}{x}+5\ln kx\ \{+c\}$	At least one of either $\pm\frac{A}{x}\to\pm\alpha\ln kx$ or $\pm\frac{B}{x^2}\to\pm\beta x^{-1}$; A, B, α, β non zero.	M1
	At least 2 out of the 3 terms are correct. At least 2 of $2x, -\frac{1}{x}, 5\ln kx$	A1
	$2x-5-\frac{1}{x}+5\ln kx\ \{+c\}$ with or without $+c$ or $2x+5\ln kx-\frac{1}{x}$ with or without $+c$ all on one line and apply isw once seen. Do not allow $+\frac{1}{-x}$ for $-\frac{1}{x}$	A1

(ii)	$\left\{ \text{I} = \int x\cos 2x \, dx \right\}$, $\left\{ \begin{matrix} u = x & \Rightarrow & \frac{du}{dx} = 1 \\ \frac{dv}{dx} = \cos 2x & \Rightarrow & v = \frac{1}{2}\sin 2x \end{matrix} \right\}$		
		$\pm \lambda x \sin 2x \pm \mu \int \sin 2x \{dx\}$ **BUT if the parts formula is quoted incorrectly score M0**	M1
	$= \frac{1}{2}x\sin 2x - \int \frac{1}{2}\sin 2x \, \{dx\}$	$\frac{1}{2}x\sin 2x - \int \frac{1}{2}\sin 2x \, \{dx\}$ simplified or un-simplified	A1
	$= \frac{1}{2}x\sin 2x + \frac{1}{4}\cos 2x \, \{+c\}$	$\frac{1}{2}x\sin 2x + \frac{1}{4}\cos 2x$ with or without $+c$, $\frac{1}{2}x\sin 2x - \left(-\frac{1}{4}\cos 2x\right)$ is A0	A1

		Question 1 Notes
(i)	**Note**	The 5ln*x* can appear in different correct forms e.g. 5ln5*x* or 2.5lnx^2 etc. and allow modulus signs e.g. $5\ln\lvert kx \rvert$
	Note	There are no marks for attempts at $\dfrac{\int 2x^2 + 5x + 1 \, dx}{\int x^2 \, dx}$
(ii)	**Note**	There are no marks for attempts at $\int x\cos x \, dx$

2.	$x=\frac{3}{2}t-5,\quad y=4-\frac{6}{t},\quad t\neq 0$		
(a)	$\frac{dx}{dt}=\frac{3}{2},\quad \frac{dy}{dt}=6t^{-2}$	**Both** $\frac{dx}{dt}=\frac{3}{2}$ or $\frac{dt}{dx}=\frac{2}{3}$ **and** $\frac{dy}{dt}=6t^{-2}$ $\frac{dy}{dt}$ can be simplified or un-simplified. **Note:** This mark can be implied.	B1
	So, $\frac{dy}{dx}=\frac{6t^{-2}}{\left(\frac{3}{2}\right)}\ \left\{=4t^{-2}\right\}$	Their $\frac{dy}{dt}$ divided by their $\frac{dx}{dt}$ **or** their $\frac{dy}{dt}$ multiplied by their $\frac{dt}{dx}$	M1
	$\left\{\text{When } t=3,\right\}\ \frac{dy}{dx}=\frac{4}{9}$	$\frac{4}{9}$	A1 **cao**
			[3]
(b)	• $t=\frac{x+5}{\left(\frac{3}{2}\right)}\Rightarrow y=4-\frac{6}{\left(\frac{x+5}{\left(\frac{3}{2}\right)}\right)}$	An attempt to eliminate t.	M1
	• $t=\frac{6}{4-y}\Rightarrow x=\frac{3}{2}\left(\frac{6}{4-y}\right)-5$ • $\frac{6}{4-y}=\frac{2}{3}(x+5)$	Achieves a correct equation in x and y only.	A1 o.e.
	$\Rightarrow y=4-\frac{9}{x+5}$		
	$\Rightarrow y=\frac{4(x+5)-9}{x+5}$		
	$\Rightarrow y=\frac{4x+11}{x+5}$	$\underline{a=4}$ and $\underline{b=11}$ or $\frac{4x+11}{x+5}$	A1
	$x\neq -5$ or $k=-5$	Do not isw so if they have $x\neq -5$, $k\neq -5$ score B0 i.e. penalise contradictory statements.	B1
			[4]
	Alternative 1 for (b):		
	$y=\frac{ax+b}{x+5}\Rightarrow 4-\frac{6}{t}=\frac{a(1.5t-5)+b}{1.5t-5+5}$		
	$\Rightarrow 4-\frac{6}{t}=\frac{1.5at-5a+b}{1.5t}\Rightarrow 6t-9=1.5at-5a+b$ $\Rightarrow 6t=1.5at$ or $-9=-5a+b$	Substitutes for x and y and "compares coefficients" for term in t or constant term	M1
	$a=4$ **or** b = 11	Correct value for a **or** b	A1
	$a=4$ **and** b = 11	Correct values for a **and** b	A1
	$x\neq -5$ or $k=-5$	Do not isw so if they have $x\neq -5$, $k\neq -5$ score B0 i.e. penalise contradictory statements.	B1
			[4]
			7

	Alternative 2 for (b):		
	$y=\frac{4t-6}{t}=\frac{3(4t-6)}{2\frac{3t}{2}}=\frac{3(4t-6)}{2(x+5)}=\frac{4\times\frac{3t}{2}-9}{(x+5)}=\frac{4(x+5)-9}{(x+5)}$ M1: Obtains y in terms of x A1: Correct unsimplified expression		M1A1
	$\Rightarrow\ y=\frac{4x+11}{x+5}$	$\underline{a=4}$ and $\underline{b=11}$ or $\frac{4x+11}{x+5}$	A1
	$x\neq-5$ or $k=-5$	Do not isw so if they have $x\neq-5$, $k\neq-5$ score B0 i.e. penalise contradictory statements.	B1
			[4]

	Question 2 Notes	
2. (a)	**Note**	M1 can also be obtained by substituting $t=3$ into both their $\frac{dy}{dt}$ and their $\frac{dx}{dt}$ and then dividing their values the correct way round.
	Note	Some candidates may use the Cartesian form in (a) possibly having done (b) first. E.g. $y=\frac{4x+11}{x+5}\Rightarrow\frac{dy}{dx}=\frac{4(x+5)-4x-11}{(x+5)^2}\left(=\frac{9}{(x+5)^2}\right)\quad t=3\Rightarrow x=\frac{9}{2}-5=-\frac{1}{2}$ $\Rightarrow\frac{dy}{dx}=\frac{9}{\left(-\frac{1}{2}+5\right)^2}=\frac{4}{9}$ This would require a complete method to find the Cartesian equation and then B1 for the correct derivative. Then M1 for a complete method attempting the derivative and substituting for x or t and A1 for 4/9 as in the main scheme. The marks for obtaining the Cartesian equation can score in (b) provided their Cartesian equation is seen or used in (b). (i.e. if they do (a) first)

3.	$f(x) = 2^{x-1} - 4 + 1.5x,\ x \in \mathbb{R};\quad x_{n+1} = \frac{1}{3}\left(8 - 2^{x_n}\right),\ x_0 = 1.6$		
(a)	$0 = 2^{x-1} - 4 + 1.5x \Rightarrow 1.5x = 4 - 2^{x-1}$ or $4 - 2^{x-1} = 1.5x$	Sets $f(x) = 0$ and makes $1.5x$ (or kx) the subject of the formula using correct processing so allow sign errors only.	M1
	$\Rightarrow x = \frac{2}{3}\left(4 - 2^{x-1}\right) \Rightarrow x = \frac{1}{3}\left(8 - 2^{x}\right)$ (*) or $\Rightarrow x = \frac{\left(4 - 2^{x-1}\right)}{1.5} \Rightarrow x = \frac{1}{3}\left(8 - 2^{x}\right)$ (*)	$x = \frac{1}{3}\left(8 - 2^{x}\right)$ by **cso** with at least one intermediate step. Do not accept recovery from earlier errors for the A mark. **Note that the "= 0" must be seen at some point for this mark even if only from f(*x*) = 0 at the start.**	A1 *****
	Special case: Starts with $1.5x = 4 - 2^{x-1}$ **and completes method with no f(*x*) = 0 is M1A0**		
			[2]
	Alternative working backwards:		
	$x = \frac{1}{3}\left(8 - 2^{x}\right) \Rightarrow 3x = 8 - 2^{x} \Rightarrow 2^{x} - 8 + 3x = 0$ $x - \frac{1}{3}\left(8 - 2^{x}\right) = 0 \Rightarrow 3x - 8 + 2^{x} = 0$	Multiplies by 3 and collects terms to one side or collects terms to one side and multiplies by 3	M1
	$2^{x} - 8 + 3x = 0 \Rightarrow 2^{x-1} - 4 + 1.5x = 0$	Obtains $2^{x-1} - 4 + 1.5x = 0$ by cso.	A1
			[2]
(b)	$x_1 = \frac{1}{3}\left(8 - 2^{1.6}\right)$	For substituting $x_0 = 1.6$ into $\frac{1}{3}\left(8 - 2^{x_0}\right)$. This mark can be implied by $x_1 =$ awrt 1.66	M1
	$x_1 = 1.656,\ x_2 = 1.616$	$x_1 =$ awrt 1.656 **and** $x_2 =$ awrt 1.616	A1
	$x_3 = 1.645$	$x_3 = 1.645$ only **(not awrt)**	A1 **cao**
	Mark their values in the order given i.e. assume their first calculated value is x_1 etc.		
			[3]
(c)	$f(1.6325) = -0.00100095...$ or awrt -1×10^{-3} $f(1.6335) = 0.00157396...$ or awrt 1×10^{-3} or awrt 2×10^{-3}	Chooses a suitable interval for *x*, which is within 1.633 ± 0.0005 and either side of $1.63288\ldots$ and attempts to evaluate f(*x*) for both values.	M1
	Sign change (negative, positive) (and $f(x)$ is continuous) therefore root $(\alpha = 1.633)$	Both values correct awrt (or truncated) 1 sf, sign change and a conclusion	A1 **cso**
			[2]
			7

	Question 3 Notes	
3. (a)	M1	There are other methods for obtaining the printed equation but the M1 scores for setting f(x) = 0 and making kx the subject of the formula using correct processing e.g. $$0 = 2^{x-1} - 4 + 1.5x \Rightarrow \frac{2^x}{2} - 4 + 1.5x = 0 \Rightarrow 3x = 8 - 2^x \quad \text{M1}$$ $$\Rightarrow x = \frac{1}{3}\left(8 - 2^x\right) \quad (*) \quad \text{A1}$$ $$0 = 2^{x-1} - 4 + 1.5x \Rightarrow 2^x - 8 + 3x = 0 \Rightarrow 3x = 8 - 2^x \quad \text{M1}$$ $$\Rightarrow x = \frac{1}{3}\left(8 - 2^x\right) \quad (*) \quad \text{A1}$$
3. (c)	A1	**Correct solution only.** Candidate needs to state both of their values for $\text{f}(x)$ to awrt (or truncated) 1sf along with **a reason and conclusion.** Reference to change of sign **or** $\text{f}(1.6325) \times \text{f}(1.6335) < 0$ **or** a diagram **or** < 0 and > 0 **or** one positive, one negative are sufficient reasons. There must be a conclusion, e.g. $\alpha = 1.633\,(3\text{ dp})$. Ignore the presence or absence of any reference to continuity. A minimal acceptable reason and conclusion could be "change of sign, so true"
	Note	In part (c), candidates can construct their proof using a narrower range than [1.6325, 1.6335] which contains the root 1.632888767

4. (a)	$(1+px)^{-4} = 1 + (-4)(px) + \frac{(-4)(-5)}{2!}(px)^2 + \frac{(-4)(-5)(-6)}{3!}(px)^3 + ...$	see notes	M1
	$= 1 - 4px + 10p^2x^2 - 20p^3x^3 + ...$	Three of the four terms correct and simplified.	A1
	or $= 1 - 4(px) + 10(px)^2 - 20(px)^3 + ...$	All four terms correct and simplified and isw once a correct answer is seen. Must be seen in part (a).	A1
			[3]
(b)	$\left\{f(x) = \frac{3+4x}{(1+px)^4} = \right\} (3+4x)(1 - 4px + 10p^2x^2 - 20p^3x^3 + ...) = ...$ Attempts to expand (3 + 4x) $\times$ their part (a) expansion. There should be evidence of at least (3$\times$one term from part (a)) + (4$x\times$one term from part (a))		M1
	Note: $f(x) = 3 + (4 - 12p)x + (30p^2 - 16p)x^2 + (40p^2 - 60p^3)x^3 + ...$		
	$= 3 \underline{\underline{- 12px + 30p^2x^2}} - 60p^3x^3 \underline{\underline{+ 4x - 16px^2}} + 40p^2x^3$ $\Rightarrow$ $"30p^2 - 16p" = 2"(4-12p)"$ **Or** or $2"\left(30p^2 - 16p\right)" = "(4-12p)"$	**Dependent on the previous M mark** Multiplies out to give exactly two terms in x and exactly 2 terms in x^2 and attempts one coefficient = twice the other. This mark can be implied by later working. Allow x's to be present for this mark	dM1
	$30p^2 - 16p = 2(4 - 12p)$	Correct equation with no x's	A1
	$30p^2 + 8p - 8 = 0$ $\Rightarrow (10p-4)(3p+2) = 0$ or $(5p-2)(6p+4) = 0 \Rightarrow p = ...$ or $15p^2 + 4p - 4 = 0 \Rightarrow (5p-2)(3p+2) = 0 \Rightarrow p = ...$	**Dependent on the 1st M mark** Correct method for solving a 3TQ leading to at least one value. If working is shown see general guidance for solving 3TQs. If no working is shown then you may need to check to see if their 3TQ solves correctly.	dM1
	$\left\{p = \frac{2}{5}, -\frac{2}{3} \Rightarrow \text{As } p > 0, \text{ then}\right\}$ $p = \frac{2}{5}$	$p = \frac{2}{5}$ only.	A1
			[5]
(c)	$40\left(\frac{2}{5}\right)^2 - 60\left(\frac{2}{5}\right)^3$	Substitutes their $p = \frac{2}{5}$ from part (b) into their coefficient of x^3 (which comes from exactly 2 terms from their expansion)	M1
	Coefficient of x^3 is $\frac{64}{25}$	Allow $\frac{64}{25}$ or $2\frac{14}{25}$. Condone 2.56. Allow $\frac{64}{25}x^3$, $2\frac{14}{25}x^3$, $2.56x^3$ **If 2 answers are offered, score A0**	A1

			10

Question 4 Notes

4. (a)	**M1**	Uses the binomial expansion with $n = -4$ and $'x' = px$.
	Note	M1 can be given for either $1 + (-4)(px)$ or $\frac{(-4)(-5)}{2!}(px)^2$ or $\frac{(-4)(-5)(-6)}{3!}(px)^3$

(b)	**Note**	Allow recovery in part (b) from missing brackets in part (a). e.g. px^2 now becoming p^2x^2.

5.	$\mathrm{f}: x \to \mathrm{e}^{2x} - 5,\ x \in \mathbb{R}\,;\ \ \mathrm{g}: x \to \ln(3x-1), x \in \mathbb{R}, x > \frac{1}{3}$		
(i) (a)	$y = \mathrm{e}^{2x} - 5 \Rightarrow x = \mathrm{e}^{2y} - 5$ $x + 5 = \mathrm{e}^{2y} \Rightarrow \ln(x+5) = 2y$	Attempt to make *x* (or swapped *y*) the subject using correct processing so allow sign errors only.	M1
	$(y =)\,\frac{1}{2}\ln(x+5)\ \ \left\{\left(\mathrm{f}^{-1}: x \to\right)\frac{1}{2}\ln(x+5)\right\}$	$\frac{1}{2}\ln(x+5)$ or $\frac{1}{2}\ln\lvert x+5\rvert$ or $\ln(x+5)^{\frac{1}{2}}$. Correct expression ignoring how it is referenced **but must be in terms of *x*.** Do not allow $\ln(x+5).\frac{1}{2}$ or e.g. $\ln x + 5$ or $\ln(x+5$ unless the correct answer is seen previously or subsequently.	A1
